

Press a key. Move the servo.

A development story from Arduino reference video to a working ESP32 circuit

KEYPAD → CONTROL → MOTION

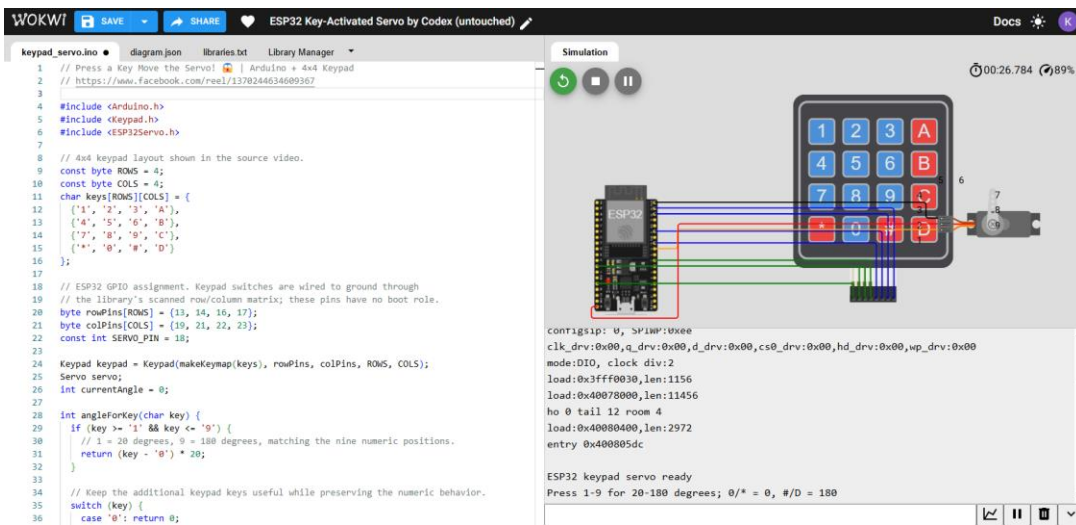

ESP32 Key-Activated Servo

How do we turn one keypress into visible motion?

The project starts with a short video reference and ends with a documented ESP32/Wokwi build.

The source video establishes the interaction—not the final hardware.

WHAT THE VIDEO GIVES US

- 4x4 keypad as the input surface
- Servo position changes after a keypress
- Arduino Uno wiring and code visible in the reel
- No accompanying written source code

Design consequence: behavior had to be extracted from video evidence before porting.

The ESP32 port preserves the interaction while changing the platform assumptions.

Porting rule: keep the user-visible behavior; replace board-specific pins and APIs.

The unmodified Wokwi circuit makes the port concrete—but exposes wiring and presentation gaps.

9 const byte ROWS = 4;
10 const byte COLS = 4;
11 char keys[ROWS][COLS] = {
12   {'1', '2', '3', 'A'},
13   {'4', '5', '6', 'B'},
14   {'7', '8', '9', 'C'},
15   {'*', '0', '#', 'D'}
16 };
17
18 // ESP32 GPIO assignment. Keypad switches are wired to ground through
19 // the library's scanned row/column matrix; these pins have no boot role.
20 byte rowPins[ROWS] = {13, 14, 16, 17};
21 byte colPins[COLS] = {19, 21, 22, 23};
22 const int SERVO_PIN = 18;
23
24 Keypad keypad = Keypad(makeKeymap(keys), rowPins, colPins, ROWS, COLS);
25 Servo servo;
26 int currentAngle = 0;
27
28 int angleForKey(char key) {
29   if (key >= '1' && key <= '9') {
30     // 1 = 20 degrees, 9 = 180 degrees, matching the nine numeric positions.
31     return (key - '0') * 20;
32   }
33
34   // Keep the additional keypad keys useful while preserving the numeric behavior.
35   switch (key) {
36     case '0': return 0;
```

UNMODIFIED BUILD

- ESP32, keypad, and servo are present
- Initial routing was difficult to read
- Keypad connections were not visibly rendered
- Serial Monitor behavior was unclear

The next iteration is a touch-up pass, not a change in project intent.

Reference circuits resolved the connection format; layout changes made the result readable.

WHAT CHANGED

- Numeric ESP32 endpoints match references
- Keypad wires are visible and color-separated
- Servo moved away from keypad for clarity
- Angle labels 0–9 added around the servo
- Serial-monitor links retained for runtime output

The final circuit is a simple three-stage loop: scan, translate, actuate.

One press → one command

The BOM stays intentionally small: one controller, one input surface, one actuator.

COMPONENT	QTY	ROLE
ESP32 DevKit C V4	1	Controller
4×4 membrane keypad	1	User input
Micro servo	1	Angle output
Wires	As required	Signal + power

The “touch-up” work changes readability and confidence—not the BOM.

The final map avoids the reference board's Arduino pin assumptions while keeping the matrix model intact.

FINAL ESP32 MAP

R1–R4	13, 14, 16, 17
C1–C4	19, 21, 22, 23
Servo PWM	18
Servo V+ / GND	5V / GND.2

REFERENCE PATTERN USED

- Keypad reference: matrix pins map directly to R1–R4 and C1–C4
- Servo reference: GPIO 18 + 5V + common ground
- Serial reference: TX/RX connected to the monitor endpoints

The keypad becomes a compact angle selector with predictable feedback.

NUMERIC KEYS

1	20°	2	40°	3	60°
4	80°	5	100°	6	120°
7	140°	8	160°	9	180°

OTHER KEYS

0 / *	0°
A	45°
B	90°
C	135°
D / #	180°

Serial output reports the accepted key and target angle.

Each issue produced a concrete rule for the final build.

Invisible keypad wires

Use reference-compatible numeric GPIO endpoints

Readable routing

Serial Monitor absent

Use TX/RX monitor links; open after simulation starts

Observable runtime

Held key repeats

Wait for release + debounce delay

One press = one command

Board/API mismatch

Use ESP32 DevKit C V4 + ESP32Servo

Portable port

The touched-up circuit makes the behavior inspectable in one view.

ESP32 keypad servo ready
Press 1-9 for 20-180 degrees; 0/* = 0, #/D = 180
Key 4 -> servo 80 degrees
Key 3 -> servo 60 degrees
Key 8 -> servo 160 degrees
Key # -> servo 180 degrees
Key 6 -> servo 120 degrees

VISIBLE PROOF

- Keypad wires are visible
- Servo labels 0–9 are visible
- Serial output confirms angles
- Code and circuit share the same map

Evidence is presented without claiming that Codex ran Wokwi live.

The project gained portability and clarity without changing the core interaction.

CHANGED

- Arduino Uno reference → ESP32 DevKit C V4
- Board-specific pins → ESP32 GPIO map
- Initial layout → visible, aesthetic routing
- Unclear monitor → explicit serial links

STAYED STABLE

- 4×4 keypad remains the user input
- A key still maps to a servo position
- Servo remains the visible output
- The design stays compact and teachable

Follow the evidence from source reference to final circuit.
